

We claim:

1. A kit for use with a driver in performing joint arthroplasty, said kit comprising:

a trial; and

5 a reamer for preparing a cavity in the intramedullary canal of a long bone to assist in performing a trial reduction, the reamer including a first portion for placement at least partially in the cavity of the long bone and a second portion operably connected to the first
10 portion, said second portion being removably connectable to the driver, said trial being removably attachable to said reamer.

2. The kit of claim 1:

15 wherein the driver defines a longitudinal axis thereof;

wherein said reamer defines a longitudinal axis thereof, the longitudinal axis of said reamer being coincident with the longitudinal axis of the driver when
20 said reamer is connected to the driver; and

wherein the driver is separable and connectable to said reamer along the longitudinal axis of the driver.

3. The kit of claim 1:

25 wherein said reamer includes a part thereof having a tapered external periphery;

wherein the driver includes a part thereof having a tapered internal periphery; and

30 wherein said trial includes a portion thereof having a tapered internal periphery thereof.

4. The kit of claim 1, further including a locking feature operably associated with at least one of said trial and said reamer to lock at least one of the driver and said trial to said reamer.

5

5. A kit for use in performing hip joint arthroplasty, said kit to be utilized to prepare a cavity in the femoral canal of a femur with the use of a driver and to assist in performing a trial reduction, said kit comprising:

10

a hip femoral component trial; and

15

a reamer for preparation of the cavity in the femoral canal, said reamer including a first portion for placement at least partially in the cavity of the femur and a second portion connectable to the driver, said trial and the driver being removably attachable to said reamer, so that the said reamer and the driver can be assembled to prepare the cavity and so that said reamer and said trial can be assembled to form a hip femoral component trial assembly without the removal of said reamer from the cavity.

20

6. The kit of claim 5:

wherein said reamer includes a part thereof having a tapered external periphery;

25

wherein the driver includes a part thereof having a tapered internal periphery; and

wherein said trial includes a portion thereof having a tapered internal periphery thereof.

30

7. The kit of claim 5, further comprising a second trial having at least one dimension different than said

first mentioned trial, said second trial being removeably attachable to said reamer.

8. The kit of claim 5, further including a locking feature operably associated with at least one of said reamer and said trial to lock at least one of the driver and said trial to said reamer.

9. The kit of claim 5:
wherein at least one of said reamer and the driver includes a pin extending therefrom; and
wherein the other of said reamer and the driver defines a void for receiving said pin, said pin and the void cooperating to lock said reamer to the driver.

10. The kit of claim 1, wherein said trial and said reamer are packaged in a common container.

11. A reamer for preparing a cavity in the intramedullary canal of a long bone with the use of a driver and for cooperation with an implant trial to assist in performing a trial reduction, said reamer comprising:

a first portion for preparation of the cavity in the canal, the first portion adapted for placement at least partially in the cavity of the long bone; and

a second portion operably connected to the first portion, said second portion connectable to the driver to rotate said reamer, said reamer being removably attachable to the trial and to the driver.

12. The reamer of claim 11:

wherein the first portion defines a longitudinal axis thereof;

wherein the second portion defines a longitudinal axis thereof, the longitudinal axis of the second portion
5 being coincident with the longitudinal axis of the first portion; and

wherein said reamer is separable and connectable to the driver and the trial along the longitudinal axis of said first portion.

10

13. The reamer of claim 11, wherein said reamer includes a portion thereof having a tapered external periphery.

15

14. The reamer of claim 11, further including a locking feature adapted to lock the trial and the driver to said reamer.

20

15. The reamer of claim 12:
wherein said long bone comprises a femur; and
wherein said implant trial comprises a hip femoral implant trial.

25

16. A method for providing joint arthroplasty comprising:

resecting a long bone;

opening a medullary canal of the long bone;

providing a reamer including a surface for the removal of bone;

30

attaching a driver to the reamer;

positioning the reamer in the canal;

reaming a cavity in the canal with the reamer;
detaching the driver from the reamer;
providing a trial;
attaching the trial to the reamer; and
5 performing a trial reduction.

17. The method of claim 16 further comprising the steps of:

removing the reamer and the trial;
10 providing a joint prosthesis; and
implanting the joint prosthesis in the cavity

18. The method of claim 16:

wherein the providing the reamer step comprises
15 providing a reamer with the reamer having an externally tapered shaft;

wherein the attaching the driver step comprises attaching a driver having an internally tapered shaft to the externally tapered shaft of the reamer; and

20 wherein the providing the trial step comprises providing a trial having an internally tapered shaft fitted to the externally tapered shaft of the reamer.

19. The method of claim 16, wherein the long bone a
25 femur.

20. A driver for use with a reamer to prepare a cavity in the intramedullary canal of a long bone, said driver including indicia thereon corresponding to at least
30 one of a bony landmark on a patient and a portion of a trial or an implant.
